FORMULA SHEET

Properties of Equality

If $A$, $B$, and $C$ represents algebraic expressions, then:

1. If $A = B$, then $A + C = B + C$. Addition Property
2. If $A = B$, then $A - C = B - C$. Subtraction Property
3. If $A = B$, then $CA = CB$. Multiplication Property
4. If $A = B$, and $C \neq 0$ then $\frac{A}{C} = \frac{B}{C}$. Division Property
5. $C(A + B) = (A + B)C = AC + BC$. Distribution Property

Strategy for Solving Linear Equation in One Variable

- Eliminate parentheses using the distributive property, and then combine any like terms.
- Use the addition or the subtraction property of equality to write the equation with all variable terms on one side, and all constants on the other side. Simplify each side.
- Use the multiplication or the division property of equality to obtain an equation of the form $x$ is a constant.

Strategy for Solving Word Problems

- Gather and organize information.
  Read the problem several times, forming a mental picture as you read. Highlight any key phrases. List given information, including any related formulas. Clearly identify what you are asked to find.
- Make the problem visual.
  Draw and label a diagram or create a table of values, as appropriate. This will help you see how different parts of the problem fit together.
- Develop an equation model.
  Assign a variable to represent what you are asked to find and build any related expressions referred to in the problem. Write an equation model based on the relationships given in the problem. Carefully re-read the problem to double-check your equation model.
- Use the model and given information to solve the problem.
  Substitute given values, then simplify and solve. State the answer in sentence form, and check that the answer is reasonable. Include any units of measure as indicated.

Special Factorizations

$$x^2 - y^2 = (x + y)(x - y)$$
$$x^2 \pm 2xy + y^2 = (x \pm y)^2$$
$$x^3 - y^3 = (x - y)(x^2 + xy + y^2)$$
$$x^3 + y^3 = (x + y)(x^2 - xy + y^2)$$

A polynomial that cannot be factored is called a prime polynomial.
Linear Equation

- Given the two points \((x_1, y_1)\) and \((x_2, y_2)\), the slope of the line passing through these points is

\[
m = \frac{\Delta y}{\Delta x} = \frac{y_2 - y_1}{x_2 - x_1}
\]

- Standard form of the equation of a line is given by

\[
Ax + By = C
\]

- Slope-intercept form of a line is given by

\[
y = mx + b
\]

- Point-slope form of a line is given by

\[
y - y_1 = m(x - x_1)
\]

- \(x\)-intercept: \((x, 0)\)

- \(y\)-intercept: \((0, y)\)

- Two lines are parallel if \(m_1 = m_2\).

- Two lines are perpendicular if \(m_1 = -\frac{1}{m_2}\), where \(m_2 \neq 0\).

Quadratic Equation

- Standard form of a quadratic equation:

\[
a x^2 + bx + c = 0
\]

where \(a, b,\) and \(c\) are real numbers with \(a \neq 0\).

- Quadratic formula is given by

\[
x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}
\]

- Given that \(f(x) = ax^2 + bx + c\), where \(a, b,\) and \(c\) are real numbers with \(a \neq 0\), the vertex of \(f(x)\) is given by the point \((h, k) = \left(-\frac{b}{2a}, f\left(-\frac{b}{2a}\right)\right)\).

Statistics and Probability

- **Mean**: The mean of a set of quantitative data is equal to the sum of all the measurements in the data set divided by the total number of measurements in the set.

- **Median**: The median is the middle measurement when the measurements are arranged in ascending or descending order.

- **Mode**: The mode is the most frequently occurring measurement in a data set.
